Rivera 2024

Title: Morning light and sleep onset.

Methods: Adults aged 25 to 40 years used Intervention X.

The trial compared the program with a usual routine.

Results: Reported outcomes for sleep onset follow.
The reported evidence supports the effectiveness of Intervention X.
Intervention X produced a statistically significant improvement in sleep onset latency.
In Rivera 2024 the primary outcome improved by 18 minutes.

Limitations of the Rivera 2024 trial are listed here.

A reported limitation is the narrow age range of 25 to 40 years.

A reported limitation is that follow-up lasted 6 weeks.

Outcomes after 6 weeks were not measured.
